

What Goes Into a CleanMax Commercial Vacuum, **STAYS IN THE VACUUM!**

HEPA (High-Efficiency Particulate Air) filters trap 99.97% of airborne particles 0.3 microns and larger—the hardest size to trap and the optimal size to enter the human respiratory system.

Pollen

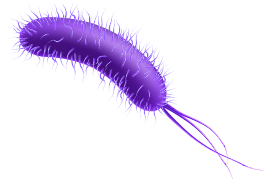

(20-80 Microns)

Dust Mites Debris

(0.01-3 Microns)

Bacteria

(0.1-10 Microns)

Just How Small is a Micron?

One micron is equal to .00004 inches. A single grain of beach sand is approximately 100 microns!

Putting Hepa Effectiveness Into Perspective

HEPA rated filters capture common irritants such as pollen, ragweed, dust mites, pet dander, bacteria and even tobacco smoke, preventing them from being re-circulated into the air.

HEPA filters also cut down on overall cleaning time by dramatically reducing the need to dust.

CleanMax Nitro, Zoom, Backpack and Pro Series vacuums all come equipped with HEPA media filters. The Pro Series also includes a HEPA Media Bag and HEPA Media Post Filter.
